

IIS OP-GL Security Monitor

Automated web-attack detection for the OPEXUS environment — how it works

LIVE · every 30 min

Detection flow — runs every 30 minutes

Confidence ladder — alerts fire only at the top

LOGGED	Known & normal → recorded, no alert
REVIEW	New entity or threshold breached → investigate
CONFIRMED	Multiple detections agree on the same actor
HIGH	Corroborated by another security system → ALERT

Why it's strong

- ▶ **High confidence, low noise** — an alert needs evidence from ≥2 independent systems, so the SOC gets signal, not fatigue.
- ▶ **Nothing slips through** — every new IP/user/URL reviewed from its first request; 17 detections + a daily AI sweep for subtle/novel attacks.
- ▶ **Cost-efficient** — routine detection is plain queries (no AI, ~zero cost, 48×/day); Opus used only on a confirmed HIGH and once daily.
